Air/oil separation FAI FILTRI

INTRODUCTION

Thanks to many years of in-field experience regarding research, design and production of oil filters and oil separation for compressors applications, the high quality standard reached by FAI FILTRI has made it possible for the company to design and manufacture integrated groups equipped with oil filters and oil separators, thermostats and minimum pressure valves, suitable for assembly on rotary and screw compressors, which also allow a more and more accurate air cleaning in order to make it suitable for several industrial application such as: food industry, electronic, pharmaceutical , textile and mechanical industries. FAI FILTRI integrated groups are the most technologically and functionally "User Friendly" equipment on the compressed air market since they allow both air-lubricating oil separation and oil filtering. All this is made avoiding further clutter and specific operational exigencies and making any possible intervention and replacement of worn out parts definitely quicker while sharply reducing maintenance costs

GSOM series equipped with spin-on air/oil separation filter, oil filter, thermostat and minimum pressure valve.

The unique feature of FAI FILTRI integrated groups is the recovery/collection of most part of the oil contained in the compressed air flux due to screws or vanes entrainment at the lubricating stage, operated thanks to the employ of top quality materials and a better control on oil contamination levels, which allows longer intervals between maintenance interventions.

TECHNICAL DATA

MATERIALS

- D Painted and galvanized steel plate container for the air/oil separator
- Devinted steel plate container for the oil filter
- Support drilled hoses and galvanized steel bottoms
- Oil separation baffle in glass microfibers layers made of high quality borosilicate
- Oil filter baffle made of resin impregnated cellulose fibers.
- □ Filter casing unit made of oxidated aluminium casting
- D Brass minimum pressure valve
- Brass thermostat

FILTER PRESSURE VALUES

Air/oil separation filter:

Max operating pressure:	16 bar
Pulsing fatigue pressure:	0/20/0 bar 1 Hz 50.000 min. cycles
Oil filter:	
Max operating pressure:	12 bar
Pulsing fatigue pressure:	0/12/0 bar 1 Hz 50.000 min. cycles
By-pass valve	1,75 bar
	2

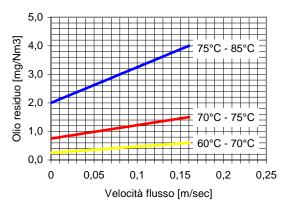

FILTERING ELEMENTS

5 bar collapse differential pressure tested in accordance with:	:	ISO 2941
Axial strain strength tested in accordance with	:	ISO 3723
Manufacturing compliance and first bubble point determination tested in accordance with :		ISO 2942

SEPARATION EFFICIENCY

By avoiding overcoming suggested nominal flow rates it is possible to reach a residual oil waste lower than 1:3 ppm

OPERATING TEMPERATURES

From -20°C to +110°C

FLOW RATES

Air/oil separation filter:

With an operating pressure up to 7 bars from 1 to 5,5 m^3 /min (See dimentional table)

Oil filter:

From 20 to 70 l/min (See dimentional table)

ASSEMBLY

For filter assembly on the block, lubricate the seal with a thin oil film and tighten by hand. Remove them by using a belt wrench

AIR/OIL SEPARATOR WORKING LIFE

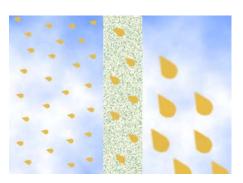

The air/oil separator shall be replaced when reaching a differential pressure (ΔP) up to **1-1,2 bar**. Market research have shown that the average life in normal working conditions can reach over **2500 hours**. Increases in the head loss and the consequent filter operating life depend on the cleanliness of the lubricating oil and of the compressed air ingested by the compressor.

FILTERING SURFACES

CTT 070	3960 cm²	2700 cm ²				

COALESCENCE EFFECT

The compressed air flux polluted by solid particles and micro drops of oil passes through the first layer of borosilicate micro fibers . At this stage micro drops, smaller than 1 micron, are agglomerated to form bigger drops according to the coalescence principle and are therefore collected and drained by the second layer of porous and synthetic material and end up, due to gravity, on the dry side of the separator.

Coalescence principle diagram

MINIMUM PRESSURE VALVE

Setting: 4,5 bar

The minimum pressure valve is assembled on the **GSO** integrated group on the air/oil separator side or on the **GS** group. This valve has to stop the outlet compressed air flux of the compressor when this latter goes under certain values. This grants the minimum pressure in the air/oil separator necessary for lubricating the screw block when restarting the compressor up.

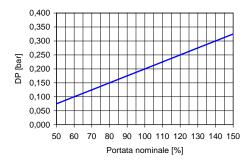

Minimum pressure valve

THERMOSTAT Thermostat operative temperature: See table for choosing the operative setting The thermostat is assembled on the GO / GSO integrated group on the oil filter side. \ reached the oil flux is diverted for cooling by the radiator. Thermostat

PRESSURE DROP

Air/oil separation filter

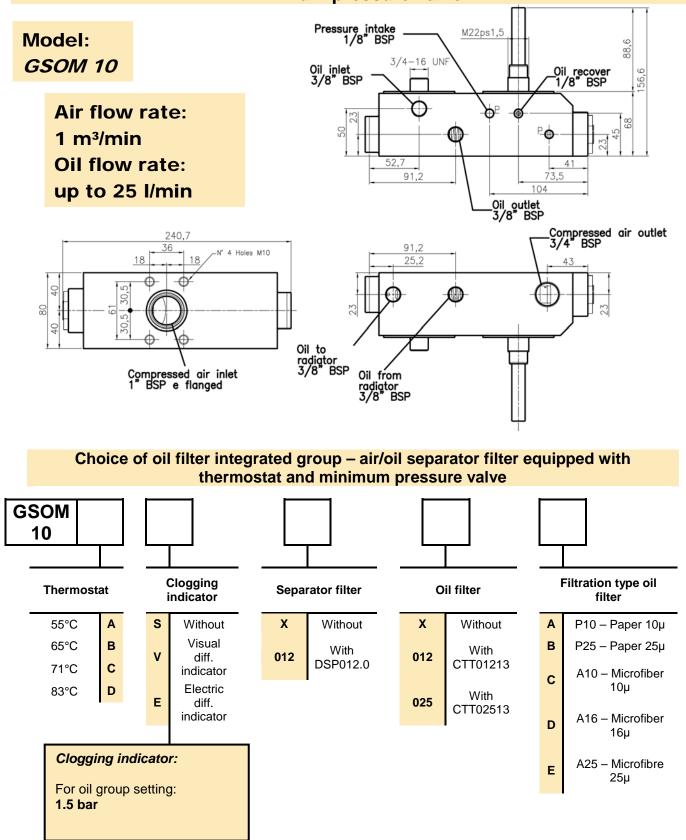

With nominal flow rate and 7 bars pressure the head pressure drop with a clean filter is up to 0,2 bars.

Oil filter

Curves are valid for mineral oil with kinematic viscosity up to 30 mm²/sec. (cSt). The ΔP varies alongside the kinematic viscosity in accordance with the following formulas:

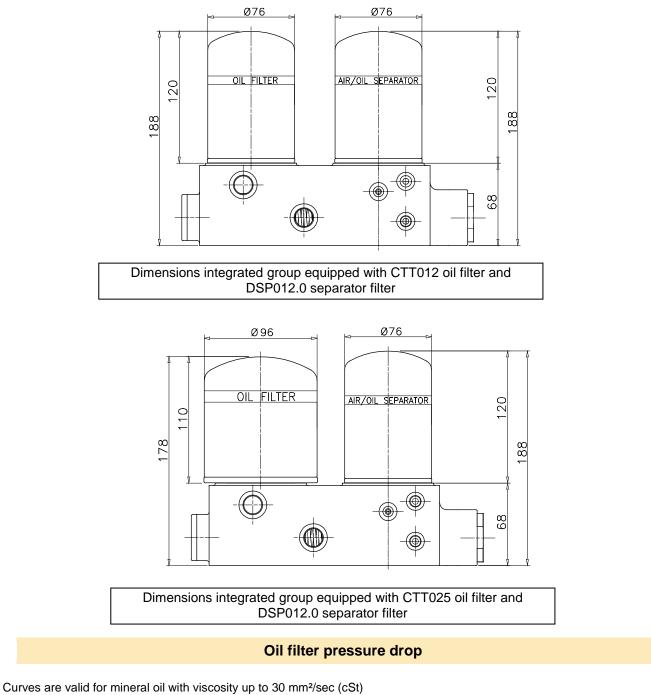

In both formulas ΔP stands for pressure drop is derived from the curves, **v** is the reference kinematic viscosity (as to say 30 mm²/sec); $\Delta P1$ is the pressure drop to be calculated and **v1** is the actual kinematic viscosity of the fluid used.
